

Gnome Sequencer Advanced for Wotlk

- 1- Try to avoid checking options that start with "Show..."—except "Show Class Macros," that's perfectly fine.
- 2- If you accidentally check something else, just head over to **Interface > Addons > GSE** and uncheck it again.
- 3- If you enable "Show verbose export/import," make sure there are no comments in the macro text when you import a macro.
- 4- The command `/gs` has been removed. Please use `/gse` or `/gsse` instead.
- 5- Macro names are automatically generated randomly when you click "Create," ensuring every name is unique. Before saving, it's a good idea to pick a unique and meaningful name yourself.
- 6- Don't forget to reload your UI after saving a macro. Type `/reload ui` to make sure everything updates.
- 7- Your first macro might have some quirks. If it's acting buggy, you might need to delete the saved file located in: **WTF > Account > ACCOUNTNAME > SavedVariables** folder.
